## 2 Basic descriptive statistics

### 2.1 Pain sites

```
data %>%
  select(-ID, -Site) %>%
  mutate_if(is.character, factor) %>%
  skim()
```

Table 1: Data summary

Name	Piped data
Number of rows	596
Number of columns	19
Column type frequency:	
factor	19
Group variables	None

### Variable type: factor

skim_variable	n_missing	complete_rate	n_unique	top_counts
Head	0	1	2	No: 401, Yes: 195
Throat	0	1	2	No: 577, Yes: 19
Shoulder	0	1	2	No: 549, Yes: 47
Arms	0	1	2	No: 571, Yes: 25
Elbows	0	1	2	No: 574, Yes: 22
Wrists.Hands	0	1	2	No: 561, Yes: 35
Chest	0	1	2	No: 479, Yes: 117
Upper_back	0	1	1	No: 596
Lower_back	0	1	2	No: 554, Yes: 42
Abdomen	0	1	2	No: 437, Yes: 159
Cervical_spine	0	1	2	No: 566, Yes: 30
Thoracic_spine	0	1	2	No: 522, Yes: 74
Lumbosacral_spine	0	1	2	No: 504, Yes: 92
Groin	0	1	2	No: 542, Yes: 54
Hips	0	1	2	No: 556, Yes: 40
Legs	0	1	2	No: 497, Yes: 99

CD4_recent	99	0.83	320.71	238.92	1	155	261	432	1232

## 2.3 Add acute/chronic pain column to demographic data

```
# Based on pain definition used in the study
## Acute assessing pain in the last 1 week or 1 month.
## Chronic assessing persistent pain in the last 3 months
demo <- demo %>%
  mutate(Pain_def = case_when(
    Site == 'RP' |
    Site == 'NM' ~ 'Acute',
    TRUE ~ 'Chronic'
  ))

# Tabulate
demo %>%
  select(Pain_def) %>%
  mutate(Pain_def = factor(Pain_def)) %>%
  skim()
```

Table 6: Data summary

Name	Piped data
Number of rows	596
Number of columns	1
Column type frequency:	
factor	1
Group variables	None

## Variable type: factor

skim_variable	n_missing	complete_rate	n_unique	top_counts
Pain_def	0	1	2	Acu: 387, Chr: 209

## 2.4 Bootstrap functions

```
# Proportion
prop_func <- function(d, i){
  dat <- d[i, ]
  dat_vec <- dat[[1]]
  dat_prop <- mean(dat_vec == 'Yes', na.rm = TRUE)
```

```

    dat_prop
  }

# Median
median_func <- function(d, i){
  dat <- d[i, ]
  dat_vec <- dat[[1]]
  dat_median <- median(dat_vec, na.rm = TRUE)
  dat_median
}

```

### 3 Proportion point estimates with 95% CIs

#### 3.1 Process data

```

# Set seed
set.seed(2020)

### 4.3 Plotted proportions (with 95% CIs), by age and body region

```
walk(sex_boot2$plots, ~ print(.x))
```

## Head and upper torso

(Point estimate with 95%CI)

## Upper limbs

(Point estimate with 95%CI)

● Female ○ Male

## Lower torso

(Point estimate with 95%CI)

● Female ○ Male

## Spinal column

(Point estimate with 95%CI)

● Female ○ Male

## Lower limbs

(Point estimate with 95%CI)

## 5 By age

For ease of tabulation and plotting in this section of the supplement, I divided age into seven age categories. However for data analysis (see: Logistic regression, section 7), I analysed age as a continuous variable.

### 5.1 Process data

```
# Set seed
set.seed(2020)

# Select age data
age <- demo[, c('ID', 'Age')]

# Join to boot_data & remove ID, study site, and upper_back
```

```

# (only one outcome -- no pain)
age <- left_join(data, age) %>%
  select(-ID, -Site, -Upper_back)

# Get complete cases
age <- age[complete.cases(age), ]

# Pivot and add age group categories (10 year periods)
age_boot <- age %>%
  # Pivot to long format
  pivot_longer(cols = -Age,
               names_to = 'body_site',
               values_to = 'pain_present') %>%
  # Add age categories
  mutate(age_group = case_when(
    Age < 28 ~ '18-27',
    Age >= 28 & Age < 38 ~ '28-37',
    Age >= 38 & Age < 48 ~ '38-47',
    Age >= 48 & Age < 58 ~ '48-57',
    Age >= 58 & Age < 68 ~ '58-67',
    Age >= 68 & Age < 78 ~ '68-77',
    Age >= 78 & Age < 88 ~ '78-87'
  ))

# Print count per age group
age_boot %>%
  group_by(body_site, age_group) %>%
  summarise(count = n()) %>%
  filter(body_site == 'Abdomen') %>%
  ungroup() %>%
  select(-body_site) %>%
  kable(caption = 'Participant count per age group')

```

Table 18: Participant count per age group

## Ankles & Feet

(Point estimate with 95%CI)

Age group 68-77 years removed because n = 2

## 6 By most recent CD4 T-cell count

For ease of tabulation and plotting in this section of the supplement, I divided the most recent CD4 T-cell count into six categories. However for data analysis (see: Logistic regression, section 7), I analysed CD4 T-cell count as a continuous variable.

### 6.1 Process data

```
# Set seed
set.seed(2020)

# Select CD4 recent data
cd4 <- demo[, c('ID', 'CD4_recent')]
```

```

# Join to boot_data & remove ID, study site, and upper_back
# (only one outcome -- no pain)
cd4 <- left_join(data, cd4) %>%
  select(-ID, -Site, -Upper_back)

# Get complete cases
cd4 <- cd4[complete.cases(cd4), ]

# Pivot and add CD4 recent group categories (counts of 100)
cd4_boot <- cd4 %>%
  # Pivot to long format
  pivot_longer(cols = -CD4_recent,
               names_to = 'body_site',
               values_to = 'pain_present') %>%
  # Add CD4 recent categories
  mutate(cd4_group = case_when(
    CD4_recent < 100 ~ '0-99',
    CD4_recent >= 100 & CD4_recent < 200 ~ '100-199',
    CD4_recent >= 200 & CD4_recent < 300 ~ '200-299',
    CD4_recent >= 300 & CD4_recent < 400 ~ '300-399',
    CD4_recent >= 400 & CD4_recent < 500 ~ '400-499',
    CD4_recent >= 500 ~ '500+'
  ))

# Print count per CD4 recent group
cd4_boot %>%
  group_by(body_site, cd4_group) %>%
  summarise(count = n()) %>%
  filter(body_site == 'Abdomen') %>%
  ungroup() %>%
  select(-body_site) %>%
  kable(caption = 'Participant count per CD4 group')

```

Table 37: Participant count per CD4 group

cd4_group	count
0-99	68
100-199	106
200-299	108
300-399	77
400-499	46
500+	92

```

# Generate CIs
cd4_boot2 <- cd4_boot %>%
  # Remove CD4 recent
  select(-CD4_recent) %>%
  # Nest by CD4 recent group and body site
  group_by(cd4_group, body_site) %>%
  nest() %>%
  # Bootstrap data
  mutate(boot = map(.x = data,

```

```

### 7.3 Plotted proportions (with 95% CIs), by age and body region

```
walk(pain_boot2$plots, ~ print(.x))
```

## Head and upper torso

(Point estimate with 95%CI)

## Upper limbs

(Point estimate with 95%CI)

● Acute ○ Chronic

## Lower torso

(Point estimate with 95%CI)

● Acute ○ Chronic

## Spinal column

(Point estimate with 95%CI)

## 8 Logistic regression

Note: Age and CD4 T-cell count treated as a continuous variables.

Note: Age and CD-4 T-cell count were scaled and centered.

### 8.1 Process data

Extract and process data on study site, participant ID, CD4 T-cell count, age, sex, and pain definition.

```
# Select demographic data
demo_logit <- demo[, c('ID', 'Site', 'CD4_recent', 'Sex', 'Age', 'Pain_def')]

# Process data
data_logit <- data %>%
  # Join with extracted demographics data (demo_reduced)
```

```

left_join(demo_logit) %>%
# Remove upper back (only one outcome -- no pain) and ID
select(-ID, -Upper_back)

# Convert data_glm to long format
data_logit.long <- data_logit %>%
  pivot_longer(cols = -c(CD4_recent, Age, Sex, Site, Pain_def),
               names_to = 'Pain_site',
               values_to = 'Pain_present')

# Scale Age and CD4_recent
data_logit.long <- data_logit.long %>%
  mutate_if(is.numeric, scale)

# Dummy code outcome variable
data_logit.long <- data_logit.long %>%
  mutate(Pain_present = ifelse(Pain_present == 'No',
                              yes = 0,
                              no = 1))

```

## 8.2 Family-wise error correction

Alpha threshold for significance was corrected to control the family-wise error rate. The correction was applied to the results of the likelihood ratio tests comparing null models to full models. We chose the conservative Dunn-Bonferroni correction.

## 8.3 Run glmer model for every body site

Note: p-values reported for the likelihood ratio tests below are uncorrected for multiple comparisons.

```

##-- Head --#
head <- data_logit.long %>%
  # Filter by pain site
  filter(Pain_site == 'Head') %>%
  filter(complete.cases())

```

Body sites with models that generated an “*is singular*” error included:

- Throat
- Arms
- Elbows
- Wrists & hands
- Abdomen
- Lower back (flanks)
- Buttocks
- Legs
- Knees
- Ankles & feet

All these models had a random error variance of 0 (or tending to 0), indicating that **site** was not contributing to the model and could be removed. That is, there is not enough additional site-level variation to warrant adding a random effect to explain all the observed variation. Analyzed these using `glm`, not `glmm`, and check for issues.

## 8.4 Run `glm` for selected body sites

Note: p-values reported for the likelihood ratio tests below are uncorrected for multiple comparisons.
